EARTH

Zero-G Entertainment

Merging fun and fitness with a smart training device for astronauts. Portable LED screens with motion sensors power reflex games, while a vest adds resistance and tracks health—keeping astronauts sharp, fit, and mission-ready.

Game Modes

There are two main game modes: "free" and "stationary."

The stationary mode includes sub-modes such as memory, learning, and musical challenges, combining physical strength (enhanced by the vest) and reflexes. In this mode, the LEDs are fixed in designated positions.

The free mode focuses on memory tasks, a race, and an All In One option, which can be played solo or with others. The screens can be set up in one location or spread out, allowing for flexible and dynamic gameplay.

Stationary

Free

LED Screens and Vest

The LED screens are compact and portable, each with motion sensors that detect player interactions.

As an essential component of the game, the vest is designed to enhance physical engagement. It includes elastic resistance bands connected to the wrists, adding a layer of physical challenge by requiring more effort in hand movements.

Additionally, the vest is equipped with a health monitor that tracks vital signs in real-time, ensuring the astronaut's physical condition is monitored during gameplay.

Let's Play!

Let's take Race Mode as an example: This mode can be played solo or competitively. In solo play, the player must press the buttons as fast as possible as they light up. In competitive mode, astronauts race to see who can "press" them first.
